

Vincent Quach

• TS CLEARANCE – ACTIVE

RF & Communications Test Engineer

San Diego, CA (626) 703-7003 vncntqch@gmail.com linkedin.com/in/vncntqch
vquach.com

U.S. Navy electronics and RF systems technician (CTM) with 6 years as lead maintainer of a mission-critical **satellite and radio communications suite** aboard a Navy destroyer, including two overseas deployments. End-to-end troubleshooter across power, hardware, RF cabling, networking, virtualization, and software, with a record of restoring high-stakes systems under operational pressure. Active Top Secret clearance. Transitioning to **RF / communications test engineering** in the space sector.

TECHNICAL SKILLS

RF & Signals	satellite comms, V/UHF radio, antennas, RF cabling & connectors	Test & Verify	operational verification testing, preventive maintenance, system audits
Networking & VM	secure virtualized environments, VMware vSphere/ESXi, vCenter, ~20 VMs	Repair	chassis, circuit cards, cabling, rack cooling, electromechanical systems
OS & Tools	Linux & Windows shell, PuTTY, system patching & certificates	Ops & Security	Top Secret clearance, encryption key management, vulnerability scanning

EXPERIENCE

Lead RF & Network Systems Technician

2021 – Present

United States Navy — Shipboard Communications Suite

San Diego, CA / deployed at sea

Ground-up systems rebuild: On temporary assignment to another vessel, led a near ground-up rebuild of its RF/communications suite — fault-isolating and restoring the full stack from power and hardware through networking to software.

RF & antenna maintenance: Refurbished 50+ antennas across the ship — running RF cables and circular connectors at height and over the side under fall-protection harness, including weatherproofing — and repaired a critical satellite-communications cable run while at sea.

System administration: Sole administrator of a secure virtualized environment of ~20 VMs on VMware vSphere/ESXi — managing credentials, patching, and software; sustained ~99% system uptime across a deployment, resolved expired security certificates blocking system startup/shutdown, and restored corrupted memory tables from backup.

Component-level repair: Diagnosed and replaced chassis, circuit cards, RF/network/electrical cabling, monitors, and rack cooling; recovered and reconfigured a corrupted network file server independently while at sea.

Upgrades, patching & compliance: Upgraded secure systems to new software baselines with vendor engineers and ran operational verification testing; implemented complex network, security, and VM patches via Linux and Windows shell and PuTTY; performed vulnerability scans and preventive maintenance inspections to certify equipment to standard.

Operations & leadership: Restored major system outages alongside vendor engineers during overseas operations and mitigated GPS interference through encryption key management; as team lead and maintenance supervisor, directed division workload and trained 10 junior technicians, and served as division safety officer and parts/supply coordinator.

EDUCATION & TRAINING

University of California, Irvine

Computer Engineering coursework — 2012–2014

U.S. Navy "CTM" School, Pensacola, Florida

Electronics, IT, & RF systems training — 2021–2022

CLEARANCE & CERTIFICATIONS

- **Top Secret Security Clearance** — active and current
- **System Administrator (USMAP apprenticeship)** — expected Jan 2027
